### REC\_Python\_Week 6\_CY

Attempt : 1  
Total Mark : 40  
Marks Obtained : 35.5

### Section 1 : Coding

#### 1. Problem Statement

Write a program to read the Register Number and Mobile Number of a student. Create user-defined exception and handle the following:

If the Register Number does not contain exactly 9 characters in the specified format(2 numbers followed by 3 characters followed by 4 numbers) or if the Mobile Number does not contain exactly 10 characters, throw an `IllegalArgumentException`. If the Mobile Number contains any character other than a digit, raise a `NumberFormatException`. If the Register Number contains any character other than digits and alphabets, throw a `NoSuchElementException`. If they are valid, print the message 'valid' or else print an Invalid message.

#### ***Input Format***

The first line of the input consists of a string representing the Register number.

The second line of the input consists of a string representing the Mobile number.

### **Output Format**

The output should display any one of the following messages:

If both numbers are valid, print "Valid".

If an exception is raised, print "Invalid with exception message: ", followed by the specific exception message.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 19ABC1001  
9949596920

Output: Valid

### **Answer**

# You are using Python

try:

```
n=input()
m=input()
b=len(n)
h=len(m)
p=0
q=0
if not n[0:2].isdigit():
    p+=1
elif not n[2:5].isalpha():
    p+=1
elif not n[5:10].isdigit():
    p+=1
if p!=0:
    raise ValueError("Invalid with exception message: Register Number should
have the format: 2 numbers,3 characters, and 4 numbers.")
q+=1
if b!=9:
    print("Invalid with exception message:Register Number should have exactly
```

```

9 characters.")
    q+=1
    if h!=10:
        print("Invalid with exception message:Mobile Number should have exactly
10 characters.")
        q+=1
    for i in range(0,h):
        if not m[i].isdigit():
            raise RuntimeError("Invalid with exception message:Mobile Number
should only contain digits.")
        q+=1
    if q==0:
        print("Valid")
except ValueError as e:
    print(e)
except RuntimeError as e:
    print(e)

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Alex is creating an account and needs to set up a password. The program prompts Alex to enter their name, mobile number, chosen username, and desired password. Password validation criteria include:

Length between 10 and 20 characters. At least one digit. At least one special character from !@#\$%^&\* set. Display "Valid Password" if criteria are met; otherwise, raise an exception with an appropriate error message.

### **Input Format**

The first line of the input consists of the name as a string.

The second line of the input consists of the mobile number as a string.

The third line of the input consists of the username as a string.

The fourth line of the input consists of the password as a string.

### **Output Format**

If the password is valid (meets all the criteria), it will print "Valid Password"

If the password is weak (fails any one or more criteria), it will print an error message accordingly.

Refer to the sample outputs for the formatting specifications.

### **Sample Test Case**

Input: John  
9874563210  
john  
john1#nhøj

Output: Valid Password

### **Answer**

# You are using Python

try:

```
n=input()
m=input()
o=input()
p=input()
q=0
w=0
d=0
e="!@#$%^&*"

```

```
for i in range(0,len(p)):
```

```
    if p[i].isdigit():
```

```
        q+=1
```

```
    elif p[i].isalpha():
```

```
        w+=1
```

```
    elif p[i] in e:
```

```
        d+=1
```

```
if(q==0):
```

```
    raise ValueError("Should contain at least one digit")
```

```
elif(d==0):
```

```
    raise RuntimeError("It should contain at least one special character")
```

```
elif(len(p)<10 or len(p)>20):
```

```
    print("should be a minimum of 10 characters and a maximum of 20 characters")
```

```
else:  
    print("Valid Password")  
except ValueError as e:  
    print(e)  
except RuntimeError as e:  
    print(e)
```

**Status :** Partially correct

**Marks :** 6.5/10

### 3. Problem Statement

Write a program to obtain the start time and end time for the stage event show. If the user enters a different format other than specified, an exception occurs and the program is interrupted. To avoid that, handle the exception and prompt the user to enter the right format as specified.

Start time and end time should be in the format 'YYYY-MM-DD HH:MM:SS'. If the input is in the above format, print the start time and end time. If the input does not follow the above format, print "Event time is not in the format "

#### **Input Format**

The first line of input consists of the start time of the event.

The second line of the input consists of the end time of the event.

#### **Output Format**

If the input is in the given format, print the start time and end time.

If the input does not follow the given format, print "Event time is not in the format".

Refer to the sample output for formatting specifications.

#### **Sample Test Case**

Input: 2022-01-12 06:10:00  
2022-02-12 10:10:12

Output: 2022-01-12 06:10:00  
2022-02-12 10:10:12

### Answer

# You are using Python

try:

```

```

**Status :** Partially correct

**Marks :** 9/10

#### 4. Problem Statement

A shopkeeper is recording the daily sales of an item for N days, where the price of the item remains the same for all days. Write a program to calculate the total sales for each day and save them in a file named sales.txt that can store the data for a maximum of 30 days. Then, read the file and display the total earnings for each day.

Note: Total Earnings for each day = Number of Items sold in that day × Price of the item.

##### **Input Format**

The first line of input consists of an integer N, representing the number of days.

The second line of input consists of N space-separated integers representing the number of items sold each day.

The third line of input consists of an integer M, representing the price of the item that is common for all N days.

##### **Output Format**

If the number of days entered exceeds 30 ( $N > 30$ ), the output prints "Exceeding limit!" and terminates.

Otherwise, the code reads the contents of the file and displays the total earnings for each day on separate lines.

Contents of the file: The total earnings for N days, with each day's earnings appearing on a separate line.

Refer to the sample output for the formatting specifications.

**Sample Test Case**

Input: 4

5 10 5 0

20

Output: 100

200

100

0

**Answer**

# You are using Python

```
N = int(input())
```

```
if N > 30:
```

```
    print("Exceeding limit!")
```

```
else:
```

```
    items_sold = list(map(int, input().split()))
```

```
    M = int(input())
```

```
    total_earnings = [item * M for item in items_sold]
```

```
    f=open("sales.txt", "w")
```

```
    for earning in total_earnings:
```

```
        f.write(str(earning) + "\n")
```

```
    f=open("sales.txt", "r")
```

```
    for line in f:
```

```
        print(line.strip())
```
